

## Automatic Placing Machine GKV 4012

The GKV 4012 placing machine is designed to automate the portioning as well as the placement of products such as fat balls for wild birds in tray packs. The machine is completed with a horizontal form fill and seal machine to form an automated line. The product is fed via a belt conveyor which fills the left or right storage hopper depending on material requirements. The fat balls are then separated by integrated counting machines and a special flap system, and discharged above the tray. The machine programs are individually created and tailored to your needs, so that special requests can also be realized.

- Developed for fat balls
- Portioning of 4, 6 or 8 fat balls (netted / unnetted)
- Placing the products in tray packaging
- Can be coupled with automated tray dispenser
- In combination with a horizontal form, fill and seal machine also usable for form, fill and seal packages without tray
- Machine programs and parameters adjustable via touchscreen
- Over 40 packs per minute possible
- Special solutions can be realized
